

Deep Learning in Quantitative SPECT and PET Image Reconstruction and Processing

Chi Liu, PhD
Associate Professor
Radiology and Biomedical Imaging
Biomedical Engineering
Yale University

Outline

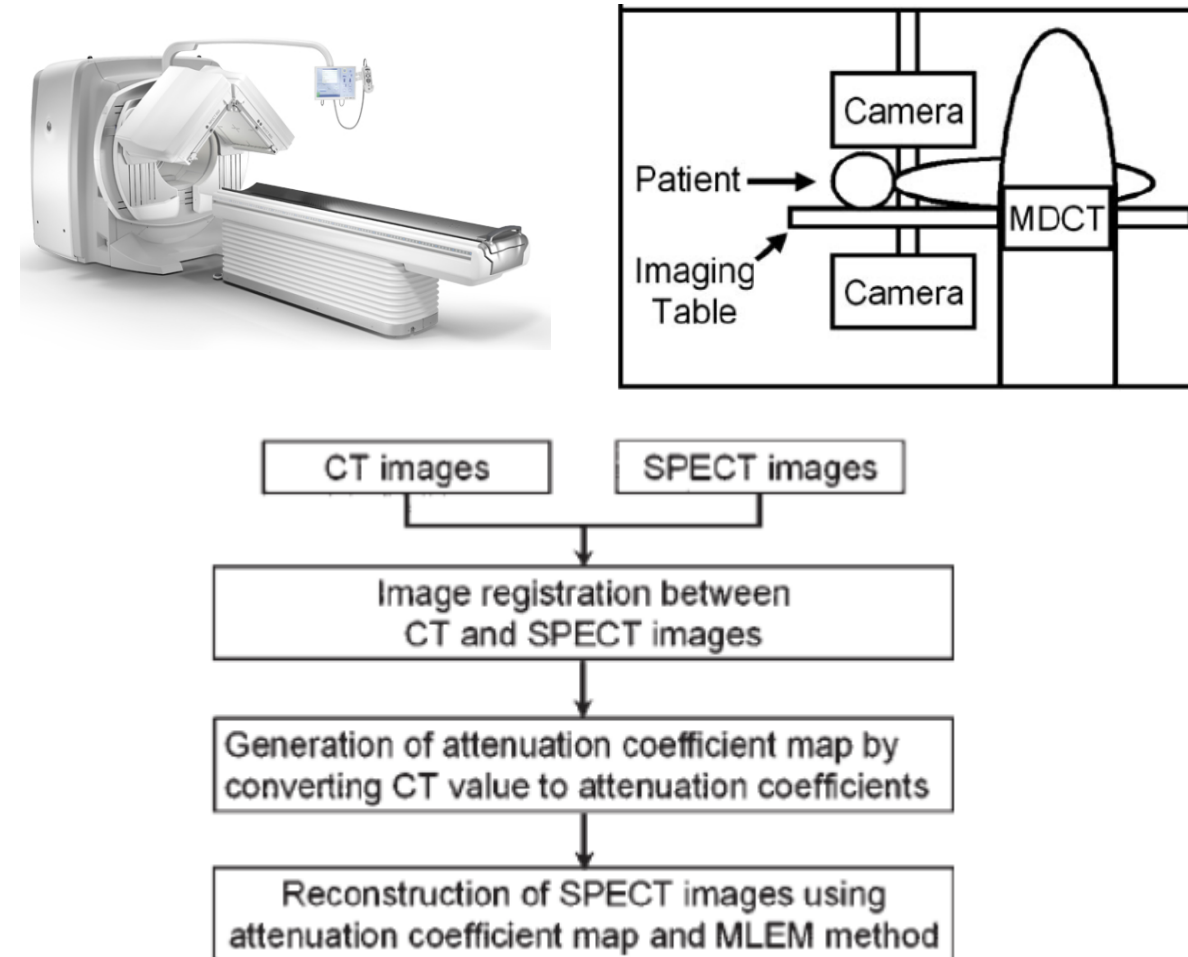

- SPECT
 - Attenuation Map Generation
 - Attenuation Correction
- PET
 - Denoising
 - Motion Correction
 - Multi-tracer Image Generation

Background and Motivation

- Accurate attenuation correction (AC) is essential for SPECT

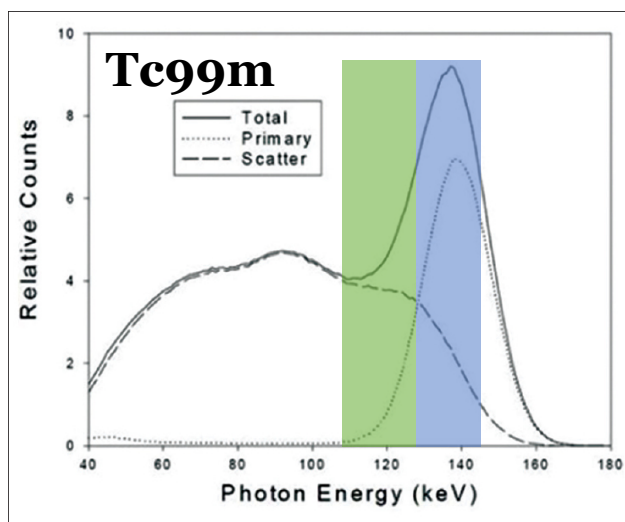

Daisuke Utsunomiya, et al. Object-specific Attenuation Correction at SPECT/CT in Thorax: Optimization of Respiratory Protocol for Image Registration

<http://www.people.vcu.edu/~mhcrosthwait/clrs318web/AC%20and%20transmission%20applicatiin.html>

GAN Training and Human Studies

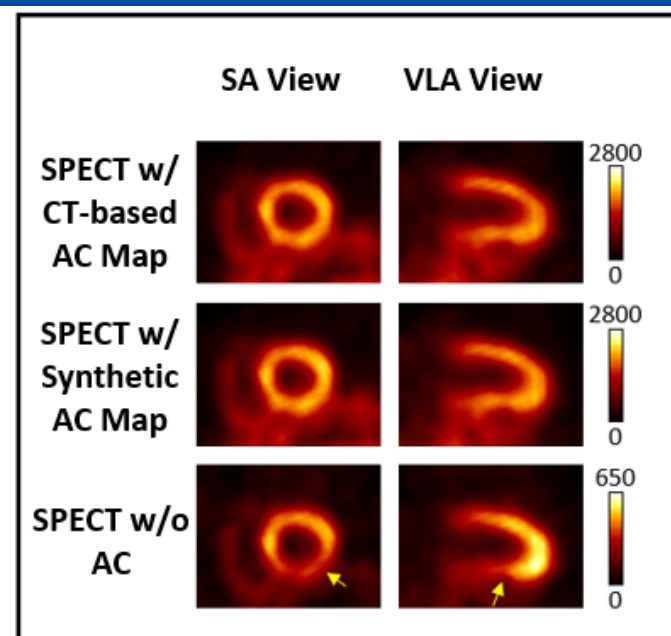

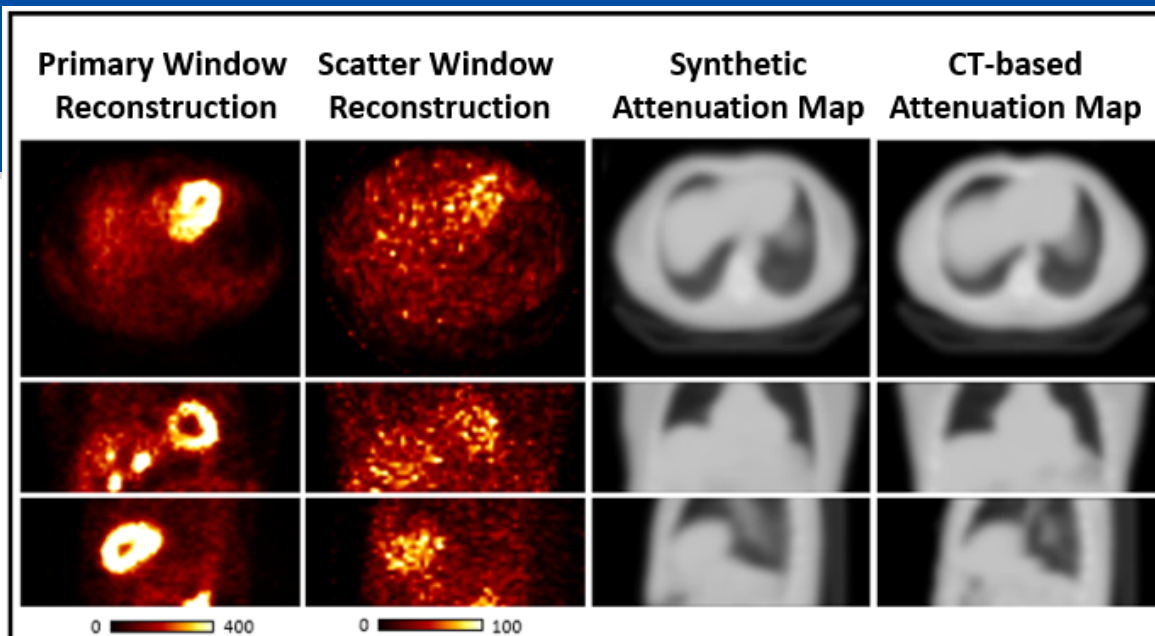

- Generator : U-net 3D
- Discriminator: CNN 3D
- 65 patient studies from YNHH
- Cardiac SPECT with ^{99m}Tc -tetrofosmin and attenuation CT scans
- GE Discovery NM/CT 850
 - Primary: 126 keV-155 keV
 - Scatter: 114 keV-126 keV

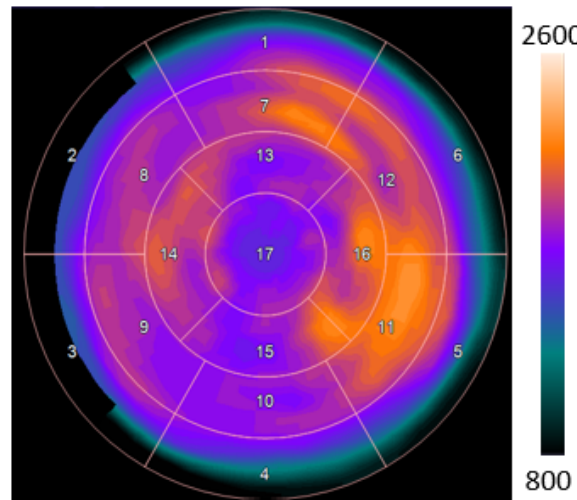

scatter window
(114keV-126keV)

primary window
(126keV-155keV)

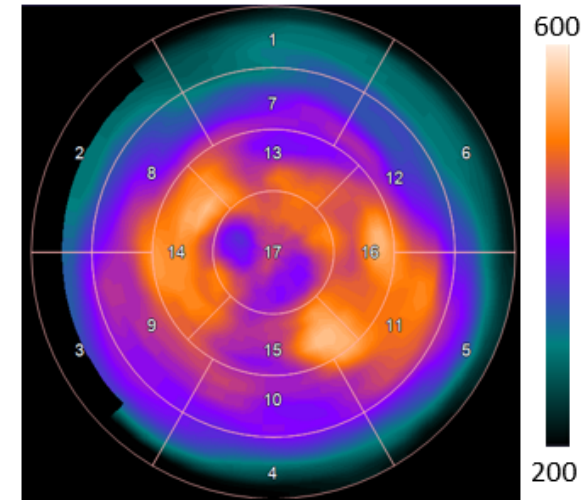

SPECT w/ CT-based AC Map

SPECT w/ Synthetic AC Map

SPECT w/o AC

Impact of Multi-channel Inputs and GAN

- Inaccurate body boundary recovery and artifacts (red arrows) were observed in GAN-P and UNET-P's results
- Incorrect blood vessel shape was observed (yellow arrows) in the results from GAN-S and UNET-S
- When using only the primary window as input, GAN obtained much better result than U-net

Visual comparison of GAN and U-Net using different inputs: both primary and scatter windows (PS), primary window alone (P) and scatter window alone (S).

Evaluation

Metric	GAN-PS	GAN-P	GAN-S	UNET-PS	UNET-P	UNET-S
%NMAE- μ	3.60±0.85	5.12±1.03	3.62±0.86	3.60±0.85	24.3±1.76	3.65±0.82
MSE- μ	189±89	270±123	192±94	185±92	2594±207	190±89
%NMAE- λ	0.26±0.15	0.30±0.17	0.27±0.16	0.26±0.15	0.92±0.48	0.27±0.16
%Bias _{myo}	3.48±2.05	5.75±3.39	4.36±2.54	3.81±2.13	37.9±9.84	3.67±2.45
%Bias _{blp}	2.43±1.42	4.34±3.04	2.69±2.06	2.49±1.52	31.5±9.08	2.46±1.86

- UNET-P produced the worst results
- The GAN counterpart (GAN-P) produced more stable results
- The GAN-PS, GAN-S, UNET-PS and UNET-S methods obtained similar NMAE and MSE on the generated attenuation maps (μ) and attenuation corrected SPECT images (λ).
- GAN-PS achieved the lowest ROI bias among all the methods
- For both GAN and U-net, the STD of bias are much lower when both primary and scatter windows were used as input, compared with the results based only on scatter input.

PET dose reduction

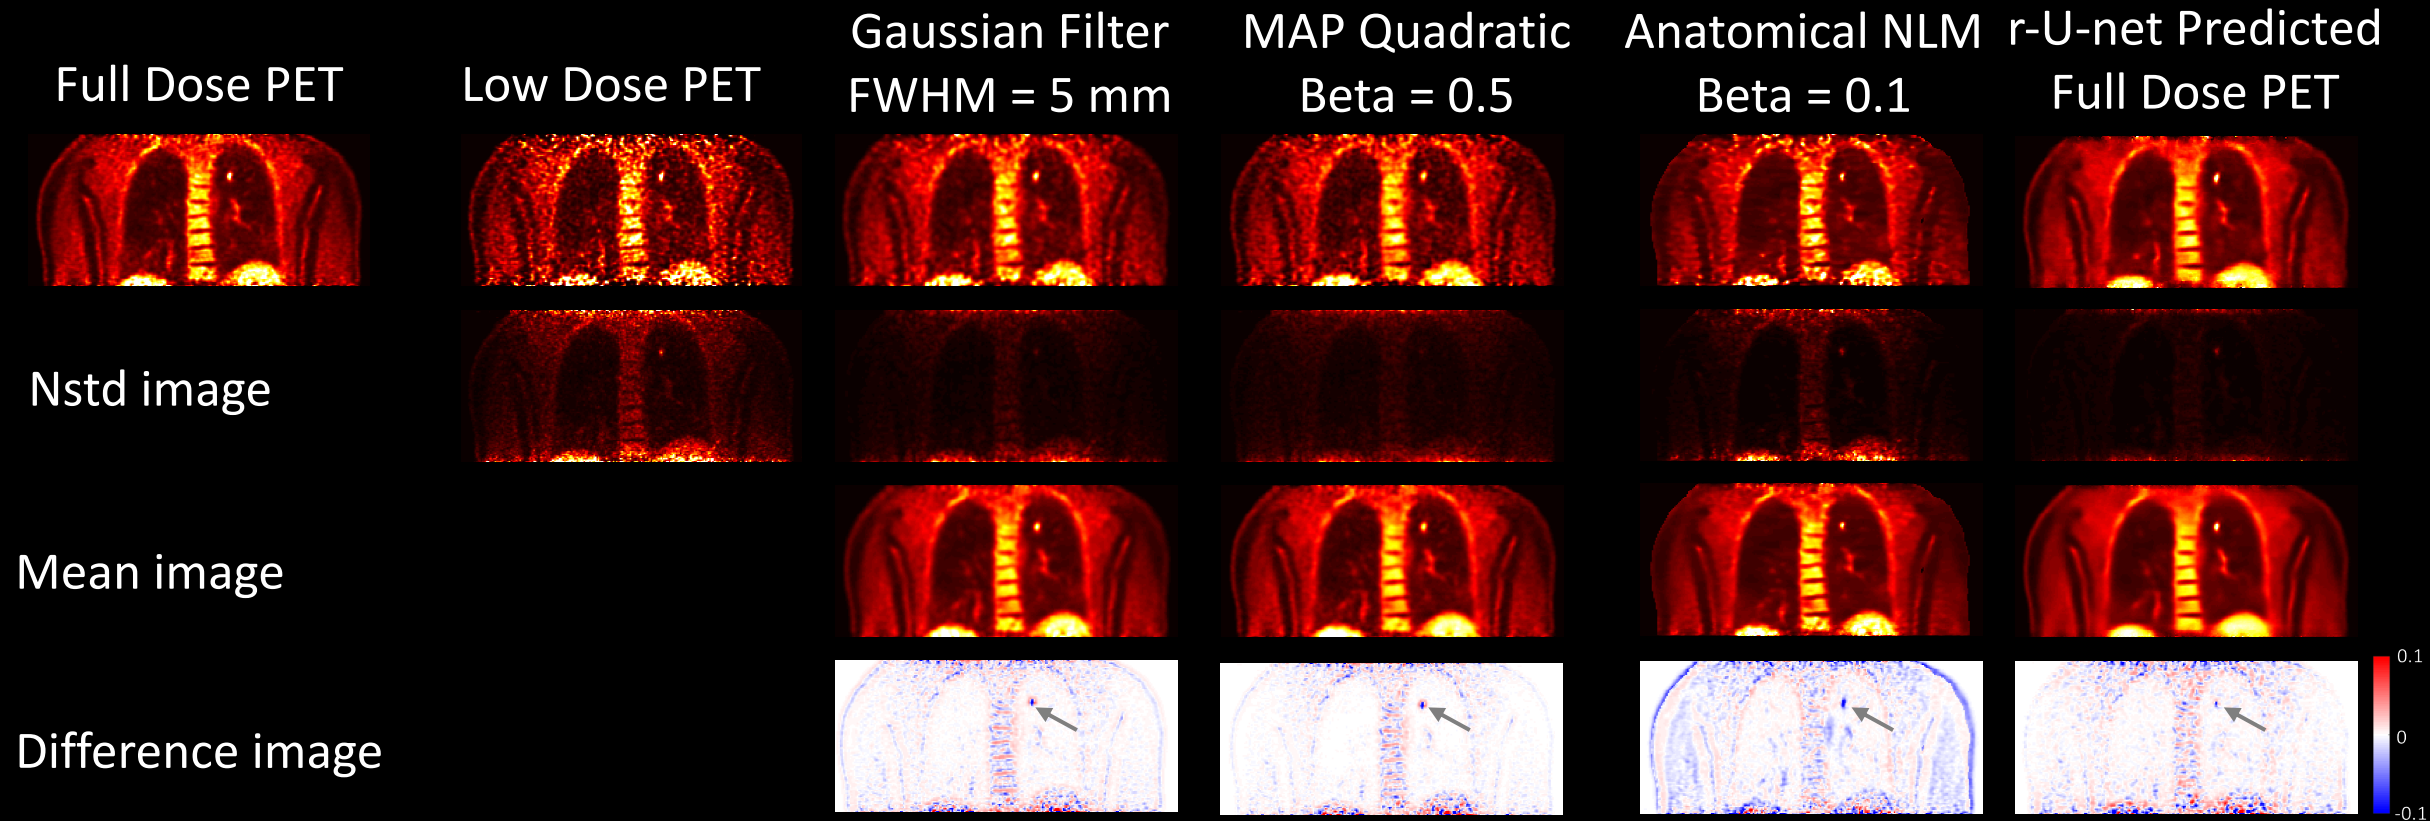

100% Dose

10% Dose

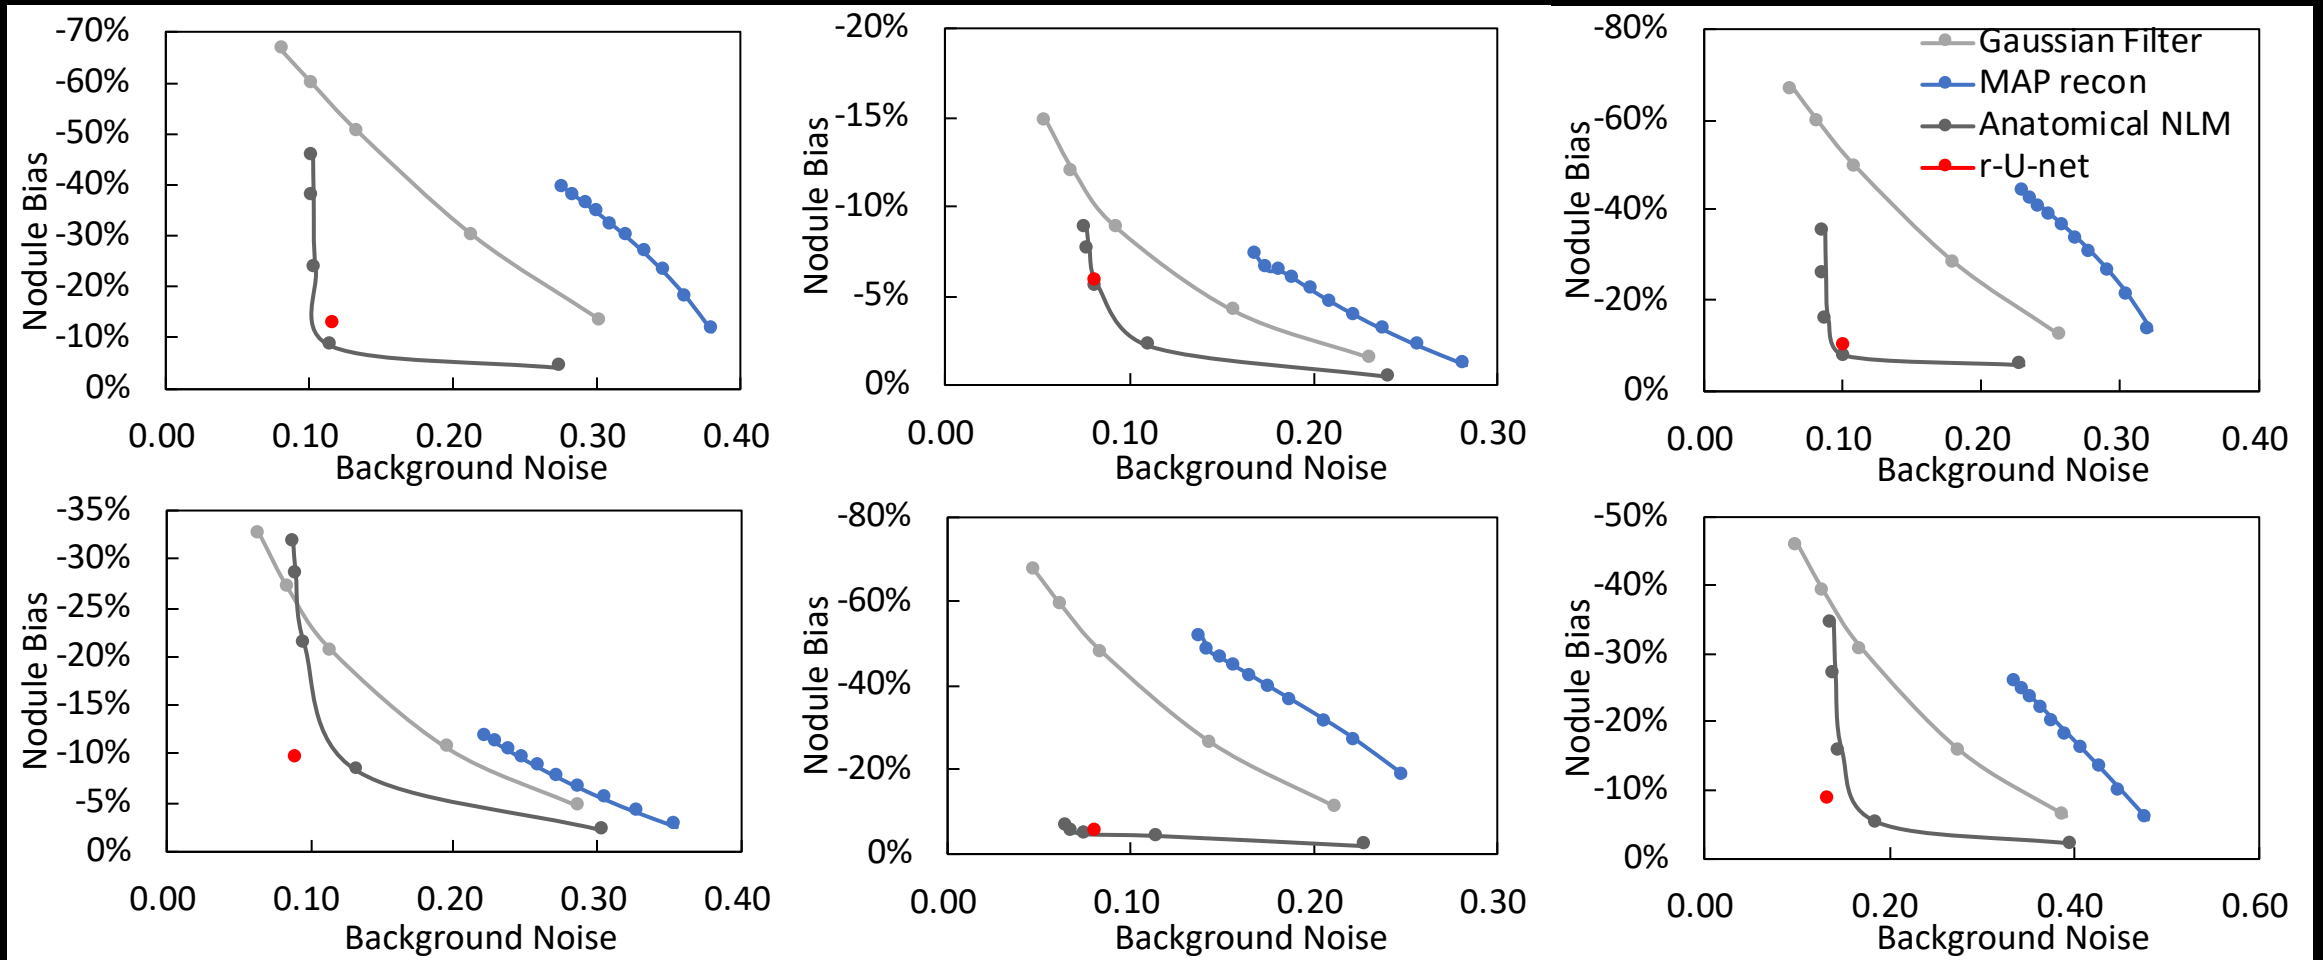

10% Dose with deep learning

Comparison with existing denoising methods

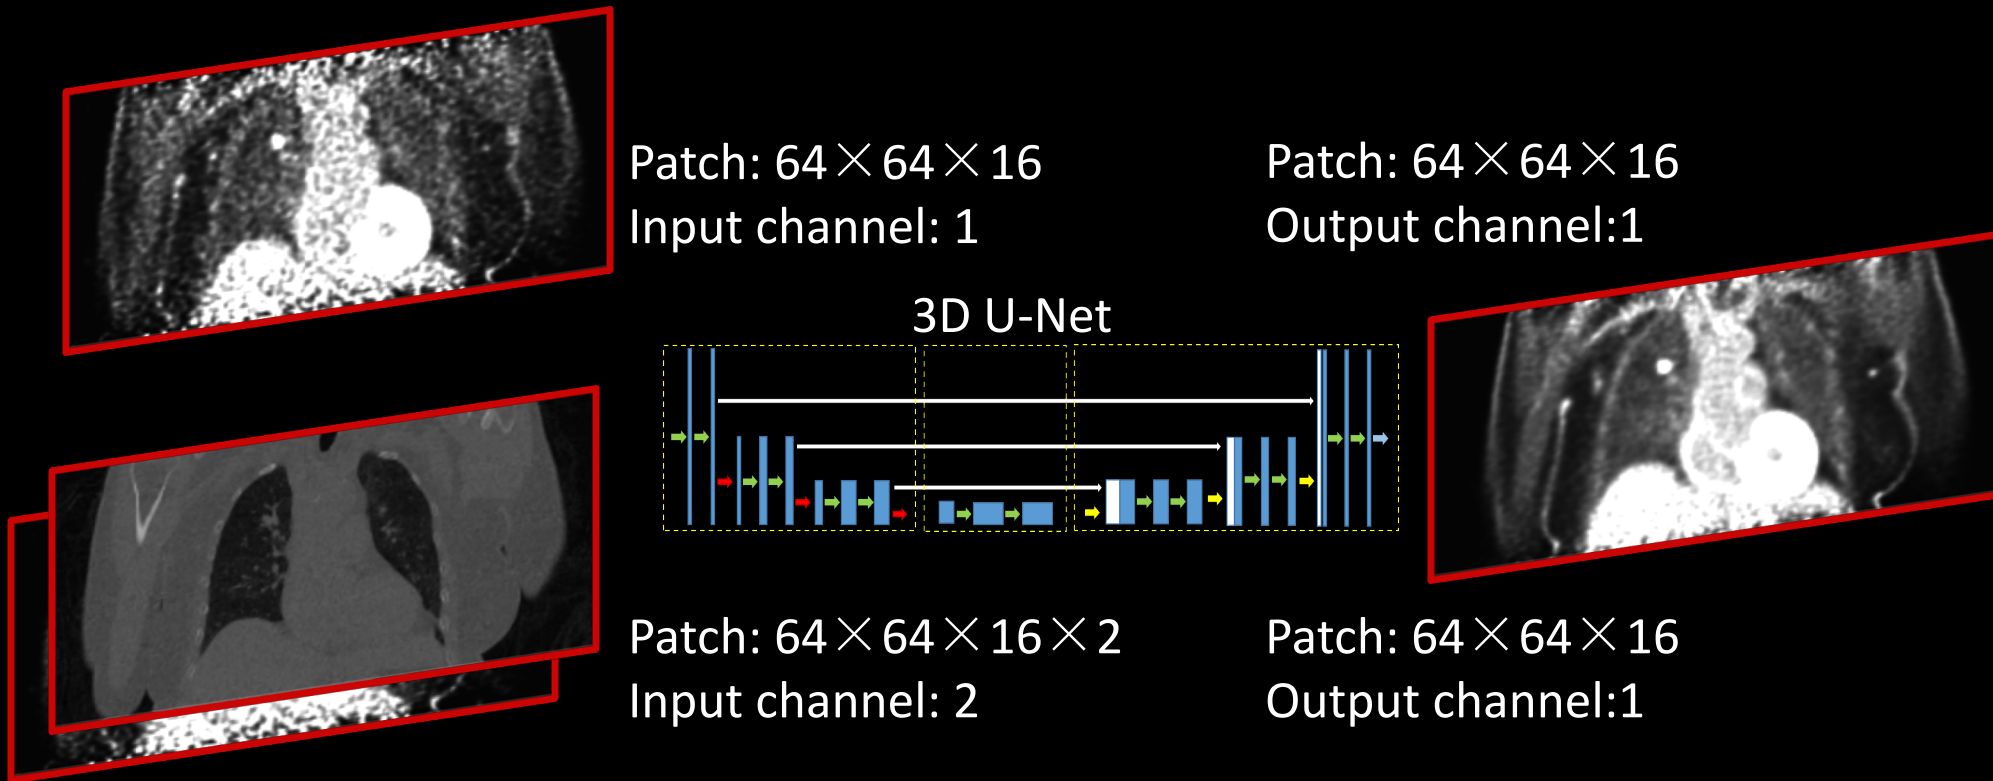

Comparison with existing denoising methods

Comparison between Low Dose PET and Low Dose PET/CT

- 10 patients with CT image and visible nodule in CT image

Comparison between Low Dose PET and Low Dose PET/CT

Patient 4
Slice 190

Comparison between Low Dose PET and Low Dose PET/CT

■ Nodule bias reduces with well-registered CT information

Comparison between Low Dose PET and Low Dose PET/CT

Patient 1
Slice 213

Comparison between Low Dose PET and Low Dose PET/CT

Patient 1
Slice 217

Comparison between Low Dose PET and Low Dose PET/CT

■ Mismatch of PET and CT degrades lesion quantification.

PennPET Explorer: Human studies

Studies performed with IRB protocol with informed consent

- CT from commercial PET/CT
 - Light restraint of arms and head to aid alignment
 - Register (rigid-body) to non-AC image

- 3 Rings: 70 cm axial length
- Spatial resolution: 4 mm
- TOF resolution: 250 ps
- Sensitivity: 55 kcps/MBq (permits low dose, fast, and late imaging)

PennPET Explorer human studies

- Two subjects were injected with 15 mCi FDG and scanned in a single bed position on PennPET Explorer scanner.

Generate virtual-high-count late and ultra-late images

- No high-count label images of late and ultra-late scans
 - Can we use the high-count early images to train the network?
 - Is the denoising performance affected by FDG distribution?

Image were normalized
according to liver uptake

Is denoising performance affected by FDG distribution?

Training network #1 using **late scan** of subject A

Testing network #1 and #2 using **late scan** of subject B

Image results: is denoising performance affected by FDG distribution?

100% count
(late scan)

25% count
(late scan)

Denoised 25% count
(trained with late scan)

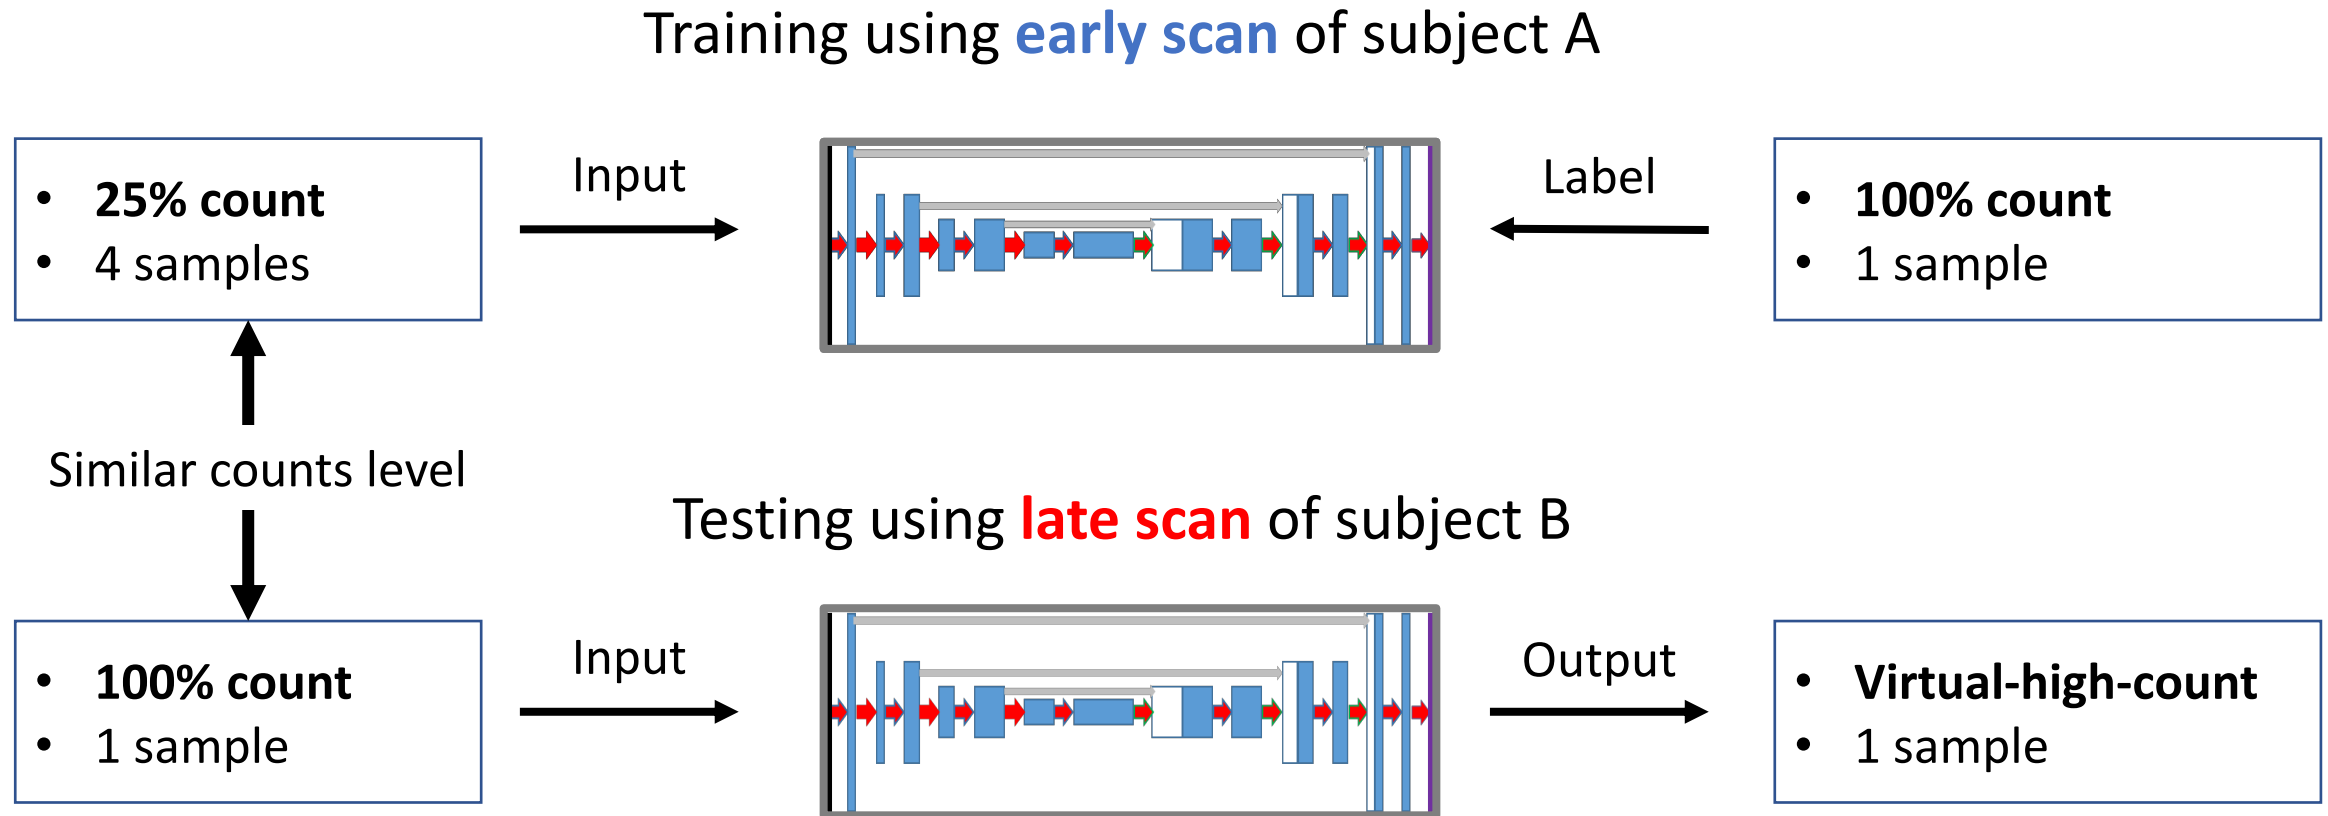

Denoised 25% count
(trained with early scan)

Quantification results:
is denoising performance affected by FDG distribution?

Late scan	Noise (std/mean)	Relative bias compared to 100% count					CNR
	Liver	Cerebellum	Bone marrow	Myocardium	Aorta wall	Inflammation	Inflammation
100% count	0.20	-	-	-	-	-	6.9
25% count	0.37 ± 0.01	$0\% \pm 1\%$	$-1\% \pm 3\%$	$0\% \pm 0\%$	$-1\% \pm 0\%$	$-1\% \pm 2\%$	3.7 ± 0.1
Denoised 25% (trained with late scan)	0.10 ± 0.002	$-2\% \pm 1\%$	$-3\% \pm 2\%$	$-1\% \pm 0\%$	$-3\% \pm 0\%$	$-2\% \pm 2\%$	13.1 ± 0.2
Denoised 25% (trained with early scan)	0.10 ± 0.002	$-2\% \pm 0\%$	$-4\% \pm 2\%$	$-1\% \pm 0\%$	$-4\% \pm 0\%$	$-4\% \pm 2\%$	12.5 ± 0.4

Generate virtual-high-count late image

Results: generate virtual-high-count late image

Late scan	Noise (std/mean)	Relative bias compared to 100% count					CNR
	Liver	Cerebellum	Bone marrow	Myocardium	Aorta wall	Inflammation	Inflammation
100% count	0.20	-	-	-	-	-	6.9
Virtual-high-count	0.07	0%	-1%	-1%	-3%	-2%	18.1

Generate virtual-high-count ultra-late image

Results: generate virtual-high-count ultra-late image

100% count

Ultra-late scan	Noise (std/mean)	Relative bias compared to 100% count			CNR
	Liver	Bone marrow	Myocardium	Inflammation	Inflammation
100% count	1.08	-	-	-	3.1
Virtual-high-count	0.04	-5%	1%	-25%	53.4

Limitation for Non-FDG tracers

- Tracer with short half-lives
 - O-15: 122.2 s
 - Rb-82: 76.4 s
- Tracer with long half-lives
 - Zr-89: 3.27 days
- **Full dose images may not be available!**
- New tracers
- Uncommonly used tracers
- **Training dataset may not be sufficient!**

Training and testing: Single bed

U-Net trained
by FDG

Fine-tuned
U-Net

U-Net trained
by FMISO

Fine tune: only the first layer and
final layer would be updated.

For Fine-tuned U-Net and U-Net trained by FMISO:
Leave out cross-validation approach was used.

Sample slices: Single bed FMISO

The de-noised image with the three U-Nets are comparable!

Cross-tracer & cross-protocol transfer learning

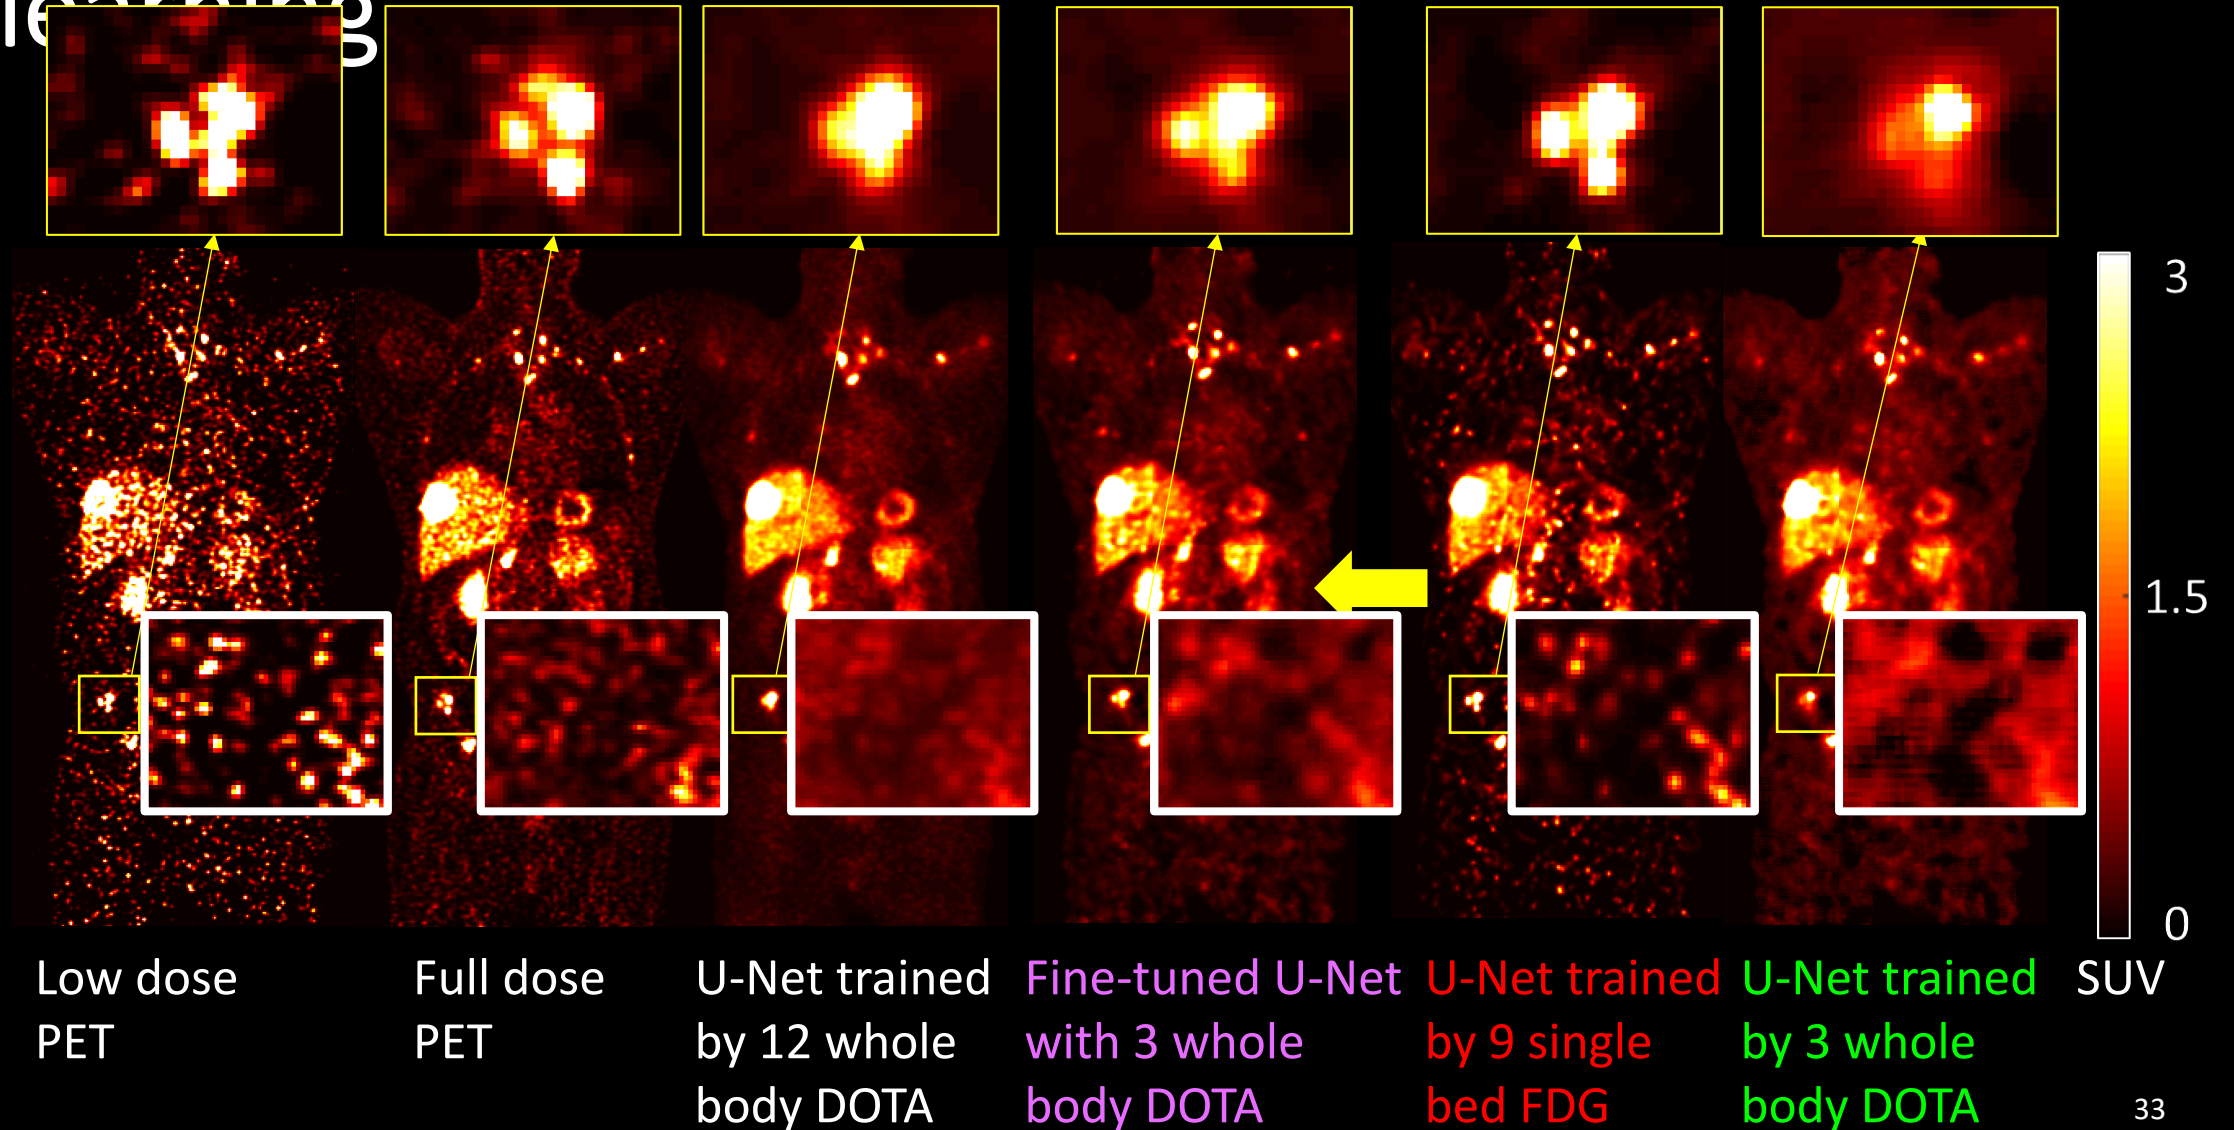

U-Net trained by 12 DOTA was used as reference.

Fine tune: only the first layer and final layer would be updated.

For Fine-tuned U-Net and U-Net trained by 3 DOTA: Leave out cross-validation approach was used.

Cross-tracer & cross-protocol transfer learning

Brain PET Imaging

- Positron Emission Tomography (PET) imaging is increasingly employed in AD studies to measure β -amyloid, tau protein, glucose metabolism, synaptic vesicle glycoprotein 2A (SV2A) and so on.

Isotope	Tracer	Tracer Description
^{18}F	FDG	glucose metabolism
^{18}F	AV-1451	tau imaging agent
^{11}C	PiB	β-amyloid
^{11}C	UCB-J	Synaptic Vesicle 2A (SV2A) ligand

Static Images of four tracers from One AD Patient

Index of Network		SV2A output	
		SUVR	BP _{nd} ratio
FDG input	SUVR	#1	#3
	K _i Ratio	#2	#4

Static Image Prediction

SV2A
SUVR

Difference
Image

Subject 2: Healthy Control

SUVR -> SUVR VS K_i ratio -> SUVR

Mean bias across all the 18 ROI

Network	Mean±SD
SUVR->SUVR	-0.4%±6.8%
K_i ratio->SUVR	-0.9%±7.0%

- Both SUVR and K_i ratio of FDG can provide robust prediction of SV2A SUVR.
- SUVR is slightly better, and is preferred as input for its easy of use

FDG \rightarrow β -amyloid

The image displays three PET scans of a human brain, showing metabolic activity. The scans are presented in axial, coronal, and sagittal views. The axial view on the left shows a cross-section of the brain with high metabolic activity in the central regions. The coronal view in the middle shows a frontal section with similar activity patterns. The sagittal view on the right shows a side profile of the brain, highlighting the activity in the cerebral cortex and subcortical structures. The scans are color-coded, with red and yellow indicating areas of higher metabolic activity.

The image displays three PET scans of a human head, showing metabolic activity in axial, coronal, and sagittal views. The scans are color-coded, with red and yellow indicating areas of high metabolic activity, primarily concentrated in the brain tissue.

The image displays three PET scans showing the distribution of ^{18}F -NaF in the spine, pelvis, and skull. The scans are arranged horizontally, showing the internal structure of the bones with varying intensities of orange and red, indicating the concentration of the tracer.

Summary

- SPECT
 - Attenuation Map Generation
 - Direct Attenuation Correction
- PET
 - Denoising
 - Motion Correction
 - simultaneous denoising and motion estimation
 - Multi-tracer Image Generation
 - FDG -> other AD tracer
